1) How many lexemes does the following Java code contain?

```
1. public class CountDigits {
2.     public static void main(String[] args) {
3.          SimpleIO.prompt("Enter an integer: ");
4.          String userInput = SimpleIO.readLine();
5.          int number = Integer.parseInt(userInput);
6.          int numDigits = 0;
7.          while (number > 0) {
8.               number /= 10;
9.               numDigits++;
10.         }
11.          System.out.println("The number " + userInput + " has " +
12.               numDigits + " digits");
13.   }
14. }
```

2)The following class contains several errors that violate the rules of Java:

```
1. class Thermometer {
2.     private int temperature
3.     public Thermometer(int degrees) {
4.        temperature = degrees;
5.     }
6.     public Thermometer() {
7.        temperature = 0.0;
8.     }
9.     public void makeWarmer(int degrees) {
10.        temperature =+ degrees;
11.     }
12.     public void makeCooler(int degrees) {
13.        temperature -= degrees;
14.     }
15.   public getTemperature() {
16.        return temperature;
17.    }
18.    public string tostring() {
19.        return temperature + " degrees';
20.    }
21. }
```

Describe each error and specify whether it is (a) lexical, (b) syntactic, or (c)semantic.

Use the numbers shown to identify the line on which each error occurs. The class may also contain programming errors that do not violate the rules of Java and will not be detected by a Java compiler. You should ignore these errors.

3) Write code in a language of your choice that checks a source file (input file in plain text format) that separates lexemes by white space and special characters. This lexical analyzer will only have tokens for special characters and alphanumeric strings.
